ELEMENT
On/Off and Control Valves
ELEMENT
Intelligent, Integrated and Beautiful

ELEMENT is the new concept from Bürkert combining controllers, valves and sensors in a highly aesthetic stainless steel design together with an intelligent architecture. ELEMENT sensors and valves reliably control fluids, gases, steam, aggressive media or contaminated fluids.

ELEMENT process valves were developed for the decentralized automation of pneumatically acting process valves. This is achieved via the optimal integration of all automation functions in the pneumatic actuator in different variants. Innovative solutions insure due to experience in critical process environments robust and reliable systems.

The construction of the intelligent ELEMENT field devices fulfil in a unique way the demands of the hygienic process technique for cleaning, selection of material and high IP protection and compactness.

Give your plant a competitive edge. The new ELEMENTs of success.
- Consistent and high class look for your equipment
- Intuitive / automatic programming
- Coloured high power LED showing the valve status
- Graphic backlit display for easy operation
- Various combination possibilities to meet the customers needs. Valves, controllers and sensors from Burkert in a consistent design
- Designed according to EHEDG guidelines for materials compatibility, smooth surfaces and external seals

- IP65/IP67 practice-oriented and consistent reliable IP protection
- Easy and robust interface to combine all automation functions of the ELEMENT program
- Over pressure as an additional protection of the control heads against ingress of humidity and condensate accumulation
- Durability against cleaning agents
- Compressed air recycling prevents the surrounding atmosphere from the actuator chambers
- High life cycle of the valves, maximum availability of your plant
- Outstanding controllability with unlimited compactness
- Digital positioner or process controller with automated parametrization for positioner and process controller
- Security coded
Actuation On/Off

Mechanical
- Optimized for cleaning and use in wet areas of hygienic processing plants
- Designed according to EHEDG guidelines for materials compatibility, smooth surfaces and external seals
- Optical on-site status indicators via colored high-power LEDs
- End position detection via micro switch, 3-/2-wire initiator to wear-free working, analogue, inductive sensor with teach function
- Integrated pilot valves with manual operation
- Control air filter protects from raw pollution
- Over pressure valve
- Electrical connection via plug-in connector M12 stainless steel or cable gland
- ATEX Zone 2/22 (optional) and Zone 1

Communication
- AS-interface
- DeviceNET

Automation concept
- Robust and practice-oriented solution for decentralized automation concepts
- Automation functions can be integrated modularly in the pneumatic actuator
- Minimalization of the electrical wiring and pneumatic piping
- Manual actuation and status indication in the field

Set up
- Extremely compact integrated actuation to pneumatic actuator
- Internal control air routing without external wiring
- Control air supply to drive chambers by compressed air recycling
- Over pressure as additional protection against condensation in the actuators
- Can be also combined with the CLASSIC actuators 2000, 2012, 2031

Look and Feel
- Exceptional

Control heads for the integrated mounting on process valves

| Type 2000 | 2/2-way angle-seal valve, DN 13-65, pneumatically operated, gunmetal or stainless steel body.
| Type 2010 | 3/2-way angle-seal valve with ELEMENT design, DN 13-50.
| Type 2012 | 2/2-way globe valve, pneumatically operated, stainless steel body, DN 10-100.
| Type 2011 | 2/2-way globe valve with ELEMENT design, DN 10-50.
| Type 2031 | 2/2-way diaphragm valve pneumatically operated, stainless steel body, DN 4-100.
| Type 2103 | 2/2-way diaphragm valve with ELEMENT design, DN 4-50.
Positioners and process controllers for the integrated mounting on process valves

**Process valves**

- **Type 2301**
  2/2-way globe control valve with ELEMENT design, DN 4-100.

- **Type 2103**
  2/2-way diaphragm valve with ELEMENT design, DN 4-50.

- **Type 8692**
  Positioner

- **Type 8693**
  Process controller

- **Type 8694**
  Positioner BASIC

- **Type 8696**
  Positioner BASIC for Bürkert’s 50 mm actuator.

---

**Positioner & Process Controller**

**Mechanical**
- Optimised for the cleaning and use in wet areas of hygienic processing plants
- Designed according to EHEDG guidelines for leak profile, material compatibility, smooth surfaces and external seals
- Contactless and wear-free position sensor
- Initiator as end position indicator
- Positioner BASIC for simple control loops
- Control air filter protects from raw pollution
- Over pressure valve
- Electrical connection via plug-in connector M12 stainless steel oder cable gland
- ATEX Zone 2/22 (optional)
- Extremely compact integrated actuation to pneumatic actuator
- Internal control air routing without external wiring
- Compressed air recycling

**Communication**
- Profibus DPV1
- DeviceNET
- AS-interface

**Set up**
- Intelligent digital process controller mit automated X-tune
- Process Controller mit automated control loop detection and parameter optimising P-tune function
- Backlit graphic display
- Binary input and 2 binary outputs
- Analogue feedback of position respectively process setpoint or position respectively actual value
- Combination with Classic control valve actuators 2702,2712 and 2731

**Look and Feel**
- Exceptional
Compatibility Advantages

**ELEMENT actuators**
Due to their hygienic design the new ELEMENT actuators have been optimized for the process control in the areas of food & beverage, diary, brewery, cosmetics and pharma. The product range allows an easy and robust integration of actuators, positioners and process controllers while offering at the same time reliable and long-lasting IP-protection for the use in wet and high humidity areas.

**Classic actuators**
The modularity allows the combination of the new On/Off Control Heads and positioners respectively process controller on our robust and worldwide proven CLASSIC actuators. Therewith the advantages of decentralized automation are used also here in an optimum way.

Want more flexibility?
The program can also be combined with other actuators of other models and valve principles. It allows a decentralized automation concept for different pneumatic components.
Innovative Functions Integrated

The ELEMENT range of control heads, positioners and process controllers offer technical innovations which effect functional reliability and lifetime of the connected actuators - this helps you to save effort, time and costs. With a maximum of flexibility for planning and installation and minimal effort for commissioning and maintenance.

Housing protected by over pressure
In the housing of types 8690 and 8691 a slight overpressure is controlled via the integrated air venting valve to prevent ingress of water and accumulation of condensate. Possibly negative pressure by cold washdown is avoided. Creation and collection of condensate is prevented.

Integrated air inlet filter
An easy to service stainless steel mesh filter protects against the infiltration of bigger particles after the plant installation and during the normal service. Functional safety and lifetime of the actuator and the actuation are optimised.

Integrated pilot valve
Proven Bürkert pilot valves with outstanding lifetime are used. Equipped with a manual actuation the in field operation of the process valve system is easy to handle. It enables the internal control air routing with compressed air recycling of the actuator.

Compressed air recycling
By internal control air supply via the integrated pilot valve both chambers of the pneumatic actuator are charged with control air. With every power stroke - open and close - control flushes from the air vent of the actuation. In no case ambient atmosphere is drawn in the spring chamber.

This means:
- no corrosion of the actuator springs
- no contamination or humidity inside the actuator
- from the actuator chambers no humidity gets inside positioner and actuation
- no contamination of the plant environment by possible biological growth in the actuation chamber
Intuitional operation: soft key combined with easy to understand menu structure

Complete and adaptable to individual needs
The innovative positioner and controller range offers a complete automation concept for integration into the most up-to-date control systems. Designed for tough and agile process environments the devices’ design is particularly suited to the specific requirements of users in the food, cosmetic, beverage and pharmaceutical industries in terms of size, shape and cleanability, footprint and access code security.

Flexibility to meet customer requirements
ELEMENT positioners and controllers offer flexible opportunities for optimizing the function for the application. Starting from the easy control task to the direct integration in fieldbus solutions with our different versions of positioners and process controllers the customized combinations for various applications are possible. ELEMENT is flexible in the choice of the valve housings no matter if it is for applications with steam, for heating and cooling processes or process media handling. Thanks to noncorrosive materials, practice oriented long life IP protection, unique compactness as well as innovations as the control air recycling to the drive chambers the ELEMENT range is the ideal solution for hygienic process technique.

As a modern control concept allows the intuitive operation of a powerful positioner and process controller. Despite the wide function range the operation is much easier; only if needed the additional functions are shown. Last but not least the parametrization of the positioner and the process controller is automated. Via P-Tune the structure and respective optimized control parameters of the process control loop are automatically and fastly detected.

Configuration Software Package
Easy and up to date configurations tools are available online. Our local technical support is glad to help you.
Sensors and Transmitters

With the ELEMEN transmitters the (control) loop with filling, pH, ORP, conductivity and flow measurement closes.

As a part of a completely modular concept all sensors and transmitters may be combined and configured to match your process needs.

At a glance you see the process status. The compact and sleek stainless steel design is especially suitable for demands in aggressive and hygienic areas. They are easy to clean, provide a perfect accuracy over a wide measurement range and they just look great. A common HMI allows an easy operation.
